

ABSTRACT

In a book-making equipment (1) in which laminated sheet papers (10) permit one elevational end side to be bonded on a work table to produce a booklet. The laminated sheet papers (10) are thrown into a hollow space between pressure surfaces (20) with the book-making equipment (1) stood on the work table. The laminated sheet papers (10) thus thrown into the hollow space, permit the one elevational end side or other end side to be trued up with the one elevational end side extended beyond the pressure surfaces (20) by a predetermined length. The laminated sheet papers (10) permit the one elevational end side to be clamped with the clutch pieces 2 stably stood on the work table. This makes it ready to bond the one elevational end side of the laminated sheet papers (10), and eliminating the necessity of the time-consuming labor and the special skill with a good appearance and bonding strength insured in the booklet.
